Customer Problem Statement :

In recent times, like blood donation the plasma donation is quite popular and have become essential. Blood plasma donations are used for slightly more specific purposes than a general blood donation. The most common uses of plasma donations include individuals who have experienced a severe trauma, burn or shock, adults or children with cancer, and people with liver or clotting factor disorders.

The plasma donation process usually consumes a lot of time and effort from both donors and medical staff since there is no concrete information system that allows donors and plasma donation centers communicate efficiently and coordinate with each other to minimize time and effort required for plasma donation process. This work aims at developing a Plasma Donation System based on the cutting-edge information technologies of cloud computing.
